Milestone 1

University of British Columbia, Vancouver
Department of Computer Science

Department of Computer Science

CPSC 304 Project Cover Page

Milestone #: 1

Date: Oct 8, 2021

Group Number: 91

Name	Student Number	CS Alias (Userid)	Preferred E-mail Address
Yining Cheng	61580544	a8g3b	carol7102@hotmail.com
Qin(Jean) Xue	72070014	u6e2b	Jeanxue0716@gmail.com
Miao Zhang	68167618	v1z2b	tresaguas1317@gmail.com

By typing our names and student numbers in the above table, we certify that the work in the attached assignment was performed solely by those whose names and student IDs are included above. (In the case of Project Milestone 0, the main purpose of this page is for you to let us know your e-mail address, and then let us assign you to a TA for your project supervisor.)

In addition, we indicate that we are fully aware of the rules and consequences of plagiarism, as set forth by the Department of Computer Science and the University of British Columbia

2. The domain of our project is a cookbook application that contains recipe of dishes.

We are going to focus on the data that is stored about recipes in a cook book application. For example the cookbook's database will include the name of the dish, the cuisine to which it belongs, the ingredients needed to make it, and the difficulty of completing it, up to five stars.

3. This cookbook's recipe collection gives a comprehensive presentation of the recipes of various dishes, as well as the ingredients needed and the steps to make them. The difficulty of making a dish is determined by the number of ingredients and steps. The users are able to search for recipe by ingredient and name. If user search for tomato, the application will pop out all of the dishes that include the use of tomato. In addition to this, the database also includes user feedback, so that users can more intuitively understand and choose the dishes they want to try. In an era of fast-paced life, where people are gradually replacing cooking with ordering takeout, the creation of this application will change people's way of life to some degree, making cooking fun with easy-to-understand steps and authentic feedback from previous users.

There will be manager account and user account. User can search recipes by dish name and ingredient and dish type, posting recipe, collecting favorite recipe and give feedback. The application manager will be able to access all of the users' data – their account information. Manager can help user to change account information.

4. We will be using PHP and Oracle to complete the construction of the database.

5

* Our final application interface will be simple and clear with no extra text, including only dish names and other key attributes. We will also insert small pictures of dishes for users to refer to.

* The relationship between recipe, rating and user account:

1. For resin ratings,

Each recipe can get many ratings from users, and we know corresponding recipe if we know a rating

2. For user rating :

Each user can write many ratings, and we know user who gives a rating if we know the rating.

3. For recipe-(rating)-user account:

Since the cardinal relationship between ratings and recipe/user account are many-to-1 relationship, the table of rating has foreign keys for recipe_id and user_id, therefore, if we know a rating, we know the person who give it and the recipe which be marked.
